THE FOUNDATION OF NEUROSTIMULATION FOR PAIN BY GIANCARLO BAROLAT PDF

Neurostimulation entails the implantation of one or more electrodes in strategic areas of the nervous system to modify or block abnormal signals stemming from a damaged nervous system. The electrodes are powered/controlled by a pulse generator, which can be either implanted under the skin or can be external. Neurostimulation has been utilized in many conditions, including epilepsy, spasticity, paralysis, urinary/fecal incontinence to name a few. Neurostimulation can be very effective in reducing severe, chronic pain and, in many instances, can be a better and safer alternative to opiates. This book covers the basic principles of neuroanatomy and neurophysiology related to neurostimulation for the management of chronic pain. The information is presented in a visual, easy to understand format and it is based on the author's experience with more than 9,000 neurostimulation devices implanted in the past 40 years. A large portion of the manual is also dedicated to the various clinical approaches, with abundant material dedicated to the various surgical techniques and imaging visualization of the implanted devices.
